# MLB and Club Classification

## Project Description

To determine the level of baseball an individual plays at, either MLB (Major League Baseball) or NCBA (National Club Baseball Association), a logistic regression model was fit. The data for the model was obtained by scraping from the NCBA and ESPN MLB websites and cleaning it. Visualizations and a dashboard were created to show the differences between individual players from each of the two leagues, and classification models were fit, resulting in the final model of a logistic regression model.
